### Roadmap

## **Reinforcement Learning with Human Feedback**

#### Part 1: RLHF The first stage of alignment is supervised finetuning (SFT).

#### Part 1: RLHF Traditionally, the second stage is reinforcement learning with human feedback (RLHF).

## Part 1: RLHF

Given preferences D : and the LM  $\pi_{\theta}$  with SF

- 1. Assume preferenc
- 2. Train  $r_{\phi}$  to maximi
- 3. Maximize  $\mathbb{E}_{x \in D, y \in \pi}$

**PPO Tutorial (Simonini, 2022)** 

#### a model $r_{\phi} : (x, y) \to \mathbb{R}$

$$x, y_w) - r_\phi(x, y_l)).$$

ences.

ng RL.

#### Part 1: RLHF RLHF works! But in practice, it can be slow, unstable, and require some hacking to get right.

## **Direct Preference Optimization (DPO)**

Part 2: DPO

# Direct Preference Optimization (DPO) directly maximizes the likelihood of preferences.

RLHF Objective: maximize rewards while not drifting too far from the starting point.  $\mathbb{E}_{x \in D, y \in \pi_{\theta}}[r(x, y)] - \beta D_{\mathsf{KL}}(\pi_{\theta}(y \mid x) \parallel \pi_{\mathsf{ref}}(y \mid x))$ 

Theoretically Optimal Reward *r*\* + Bradl Preferen

$$\mathscr{L}_{\mathsf{DPO}}(\pi_{\theta}, \pi_{\mathsf{ref}}) = \mathbb{E}_{x, y_w, y_l \sim D} \left[ -\log \theta \right]$$

Part 2: DPO

# DPO is an *offline* approach, in contrast to *online* RLHF.

#### Part 2: DPO DPO works as well as RLHF (sometimes better, due to the latter's stability issues).

## Human-Aware Losses (HALOs)

Part 3: HALOs

## The conventional view is that reward learning is essential for model alignment to work.

maximize these rewards.

•  $\pi_{\theta}$  becomes optimal (assuming preferences are Bradley-Terry).

• In RLHF, reward learning is **explicit**: learn a reward model  $r_{\phi}$ , then update  $\pi_{\theta}$  to

In DPO, reward learning is **implicit**: in minimizing the loss, the reward implied by

Part 3: HALOs

# What if we did RLHF without reward learning, using just dummy +1/-1 rewards on offline data?

**Supervised Finetuning** 

4

B

prior work

#### Part 3: HALOS Surprisingly, dummy RLHF works as well as DPO from 1B up to 13B parameters.

unaligned SFT token-conditioned max-margin baseline baseline

dotted line = parity of generated text with text we would use for finetuning Why does our dummy RLHF work so well despite not having learned rewards?

#### Part 3: HALOs The best-performing alignment losses capture key cognitive biases in human decision-making.

Kahneman-Tversky PPO-Clip S DPO

#### (Implied) Human Value

gain

reference point

Part 3: HALOs

### Human-Aware Losses

Given our policy LM  $\pi_{\theta}$ , reference LM  $\pi_{ref}$ , and a normalizing factor  $l: \mathcal{Y} \to \mathbb{R}^+$ , the implied reward is:

 $r_{0}(x, y) = l(y) \log \pi_{0}(y | x) / \pi_{rot}(y | x)$ creasing and Where Q(Y'|X)Among existing methods, HALOs (e.g., DPO, concave in (0, c)PPO) work better than non-HALOs.

f is a corresponding human-aware loss if

$$f(\pi_{\theta}, \pi_{\mathsf{ref}}) = \mathbb{E}_{x, y \sim D}[a_{x, y}]$$

where  $a \in \{-1, +1\}$  and  $C_{\mathcal{D}}$  is a data-specific constant.

 $v(r_{\theta}(x, y) - \mathbb{E}_{O}[r_{\theta}(x, y')])] + C_{\mathcal{D}}$ 

Part 3: HALOs

## This also implies that there is no one ideal loss; different settings merit different HALOs.

#### (Implied) Human Value

Kahneman-Tversky video game character financial advice bot

gain

## Kahneman-Tversky Optimization (KTO)

# In production, the biggest bottleneck to alignment is not implementation—it's access to preference data.

# Binary feedback provides a sparser signal, but is more abundant, cheaper, and faster to collect.

## Can we design a HALO that takes binary feedback as input?

hary Feedback

abundant, cheap, fast to collect!

#### Part 4: KTO

## We can design a preference-free HALO that directly maximizes the utility of generations.

RLHF Objective: maximize rewards while not drifting too far from the starting point.  $\mathbb{E}_{x \in D, y \in \pi_{\theta}}[r(x, y)] - \beta D_{\mathsf{KL}}(\pi_{\theta}(y \mid x) \parallel \pi_{\mathsf{ref}}(y \mid x))$ 

Theoretically Optimal Reward  $r^*$ 

HALO-defined Reward

+

Kahneman-Tversky Value Function (ish)

Expected Reward as Reference Point

Part 4: KTO

## Kahneman-Tversky Optimization (KTO) Loss

 $L_{\text{KTO}}(\pi_{\theta}, \pi_{\text{ref}}) = \mathbb{E}_{x, y \sim D}[\lambda_y - v(x, y)]$ 

#### control loss aversion with $\lambda_D$ , $\lambda_{II}$ ; rísk aversíon with $\beta$

use reward  $r_{\theta}(x, y) = \log \frac{\pi_{\theta}(y|x)}{\pi_{\text{ref}}(y|x)}$ 

loss

 $\frac{\lambda_D n_D}{\lambda_U n_U} \in \begin{bmatrix} 1, \frac{4}{3} \end{bmatrix}$ 

estimated value

gain

 $v(x,y) = \begin{cases} \lambda_D \sigma(\beta(r_\theta(x,y) - z_0)) \text{ if } y \sim y_{\text{desirable}} | x \\ \lambda_U \sigma(\beta(z_0 - r_\theta(x,y))) \text{ if } y \sim y_{\text{undesirable}} | x \end{cases}$ 

Use reference point

 $z_0 = \mathrm{KL}(\pi_{\theta}(y'|x) \| \pi_{\mathrm{ref}}(y'|x))$ 

in practice, share  $\hat{z}_0$  across all x in batch

Constant of the second second

#### Part 4: KTO KTO matches or exceeds the performance of baselines, sometimes without finetuning prior.

![](_page_26_Picture_4.jpeg)

Prompt	<  user  > I need some show recommend <  assistant  > Are you looking for something <  user  > This is exactly what I'm lookin <  assistant  >
SFT	Well, you've just asked for one in some combination. There as
SFT+KTO	Some great choices for you mage are all very popular and have a
SFT+DPO	Well, you might like *******, want crime. Or you might also crime and corruption in law en
	My friend has some really bad help?
	Sure! You can try to politely ex you disagree. However, it's in things. If your friend has som why you need to agree with hin enjoy the shows that he likes.

dations that are similar to Breaking Bad.

g with drama, violence, drugs, politics and murder?

ing for in a show

e of the best shows ever made, and they all have those elements are a lot of shows with those elements.

hight be Narcos, Sons of Anarchy, and Better Call Saul. They a lot of the same themes as Breaking Bad.

l opinions about TV shows, and I want to correct him, can you

xplain to your friend why his or her opinion is incorrect or why nportant to keep in mind that different people enjoy different ne strongly held opinions about TV shows, there's no reason m. You can both enjoy shows that you like and your friend can That's just the way it is.

#### Part 4: KTO KTO can handle highly imbalanced datasets, making it more tolerant of production environments.

![](_page_28_Figure_1.jpeg)

![](_page_28_Picture_3.jpeg)

#### Part 4: KTO Feedback data used for KTO does not need to come from preference datasets.

![](_page_29_Figure_1.jpeg)

![](_page_29_Figure_2.jpeg)

MMLU (Language)

GSM8K (Math)

HumanEval (Code)

BigBench-Hard

Zephyr-SFT +DPO +KTO +KTO (one y per x, sub-50% of data)

Part 4: KTO

## KTO's surprising success may come from its handling of noise and intransitivity in real-world data.

Proposition 4.1 (informal). KTO does not learn from data that is too difficult to learn from.

Theorem 4.2 (informal). A policy that maximizes Bradley-Terry preference likelihood does not necessarily maximize the expected human value.

Theorem 4.3 (informal). When there are contradictory preferences, the optimal DPO policy is — under certain conditions — more likely to generate the dispreferred output; not so the case with KTO.

#### Part 4: KTO Which alignment method should you use? It really depends on your data.

binary feedback (especially when imbalanced)

> Depending not the circumstances, others might be better. Or roll your own HALO! There is no one-loss-fits-all.

preference feedback (high enough noise, intransitivity)

(low

## Summary & Future Work

37

### Summary

![](_page_37_Figure_1.jpeg)

![](_page_37_Picture_3.jpeg)

![](_page_37_Picture_4.jpeg)

## **Open Problems**

- 1. The Kahneman-Tverksy value function was derived in the context of monetary gambles. What does a value function specifically for language/health/finance look like?
- 2. If all you care is about increasing performance on a given task, does the objective really matter (as data ->  $\infty$ )?
- 3. The discourse has converged on (over-fitted to?) paired preferences as the canonical kind of feedback. How do we move beyond that?

## Thank you!

#### HALOs

**Definition 3.4 (HALOs).** Let  $\theta$  denote the trainable parameters of the model  $\pi_{\theta} : \mathcal{X} \to \mathcal{P}(\mathcal{Y})$  being aligned,  $\pi_{\text{ref}}$  the reference model,  $l : \mathcal{Y} \to \mathbb{R}^+$  a normalizing factor, and  $r_{\theta}(x, y) = l(y) \log[\pi_{\theta}(y|x)/\pi_{\text{ref}}(y|x)]$  the implied reward. Where Q(Y'|x) is a reference point distribution over  $\mathcal{Y}$  and  $v : \mathbb{R} \to \mathbb{R}$  is non-decreasing everywhere and concave in  $(0, \infty)$ , the *human value* of (x, y) is

 $v(r_{ heta}(x,y)$ 

A function f is a human-aware loss for v if  $\exists a_{x,y} \in \{-1,+1\}$  such that:

 $f(\pi_{ heta}, \pi_{ ext{ref}}) = \mathbb{E}_{x, y \sim \mathcal{D}}[a_{x, y} v(r_{ heta}(x))]$ 

where  $\mathcal{D}$  is the feedback d constant.
